Binomial Probabilities – Inv. 1.2 and page 27

Binomial Test – Inv. 1.3

Announcements

- Hw 2 and Quiz 2 Monday, October 8th
remember to memorize the definitions!
could use online card deck, e.g. quizlet

Last time – Binomial Process

What are the four characteristics of a Binomial Process?

Last time – Binomial Process

- Each trial has **two outcomes** (Success, Failure)
- The trials are **independent** (outcome of one trial doesn't impact outcome of other trials)
- The trials have a **constant probability of success** (π)
 - Does not have to be 0.5!
- **Fixed number of trials** (n)

“All models are wrong; but some are useful”

Inv. 1.2: Do you have ESP?

Part (c) Using technology, what is the probability that a guessing subject would get 10 or more cards correct?

We are asked to compute a probability,

$$P(C \geq 10)$$

where C is the number of correct guesses out of 25 cards.

So far, we know two ways of computing probabilities...

P-value via Simulation

Simulation-Based and Exact One Proportion Inference

Probability of success (π): 0.2

Sample size (n): 25

Number of samples: 999

Animate

Draw Samples

Total = 999

Number of successes

Proportion of successes

As extreme as \leq 10 Count

Proportion of samples:
22 / 999 = 0.0220

Two-sided

Exact Binomial

$P(X \geq 10) = 0.0173$

Normal Approximation

Reset

All Attempts (Last Sample)

This is our estimate of $P(C \geq 10)$ using simulated coin tosses

Summary Stats

P-value via Exact Mathematical Calculations

Simulation-Based and Exact One Proportion Inference

Probability of success (π):

Sample size (n):

Number of samples:

Animate

Total = 999

Number of successes

Proportion of successes

As extreme as

Proportion of samples:
22 / 999 = 0.0220

Two-sided

Exact Binomial

$P(X \geq 10) = 0.0173$

Normal Approximation

All Attempts (Last Sample)

Successes (Last Sample) = 8

Failures (Last Sample) = 19

This is the exact calculation of $P(C \geq 10)$ using a math formula

Inv. 1.3: Binomial Test

Who is on the left,
Bob
or
Tim?

No discussion of your responses!

Results of Tim/Bob Survey for (c)

Of students, chose Tim as on the left

Inv. 1.3 - In class activity

- Try parts (a), (b), (c), (d), (e)

Inv. 1.3: Binomial Test

- (a) Null model: random guessing implies students are equally like to assign names Bob and Tim to either face
- (b) Two outcomes, everyone guessing, **no discussion/encouragement of your responses**, fixed number of students.

Terminology Detour – Tim/Bob Survey

- Observational Units?
- Variable?
- Type of variable?
- **Parameter vs. Statistic**
(part f)

Inv. 1.3 – parts (g) and (h)

Question: Do most people identify “Tim” as the guy on the left?

Parameter: let π be the proportion of people who pick “Tim” to be on the left.

Null Hypothesis:

$$\pi = 0.5$$

i.e. people are just guessing.

Alternative Hypothesis:

$$\pi > 0.5$$

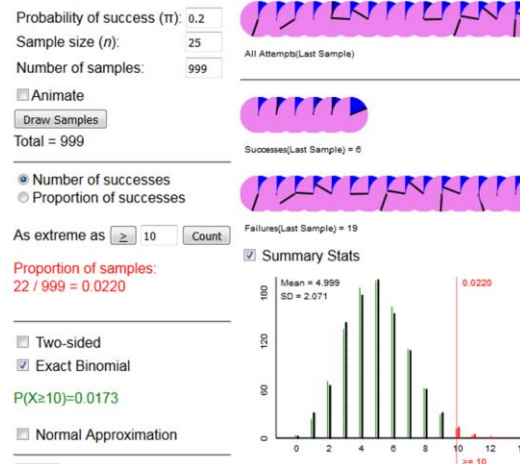

i.e. the majority of people pick Tim to be on the left.

P-value

In order to decide whether we believe the null hypothesis, we'll compute a **p-value**.

A **p-value** is the probability of seeing a **statistic** as extreme as ours if the null model is true.

Simulation-Based and Exact One Proportion Inference

We can use the exact formula or coin toss simulation from the One-Proportion Applet IF our data collection is a Binomial Random Process

Inv. 1.3 – part (j)

Rossman/Chance

Need to identify n and π
to compute the p-value
with the **exact Binomial**
probability formula

Simulation-Based and Exact One Proportion Inference

Probability of heads:
Number of tosses:
Number of repetitions:

Animate

Total = 0

Number of heads

Proportion of heads

As extreme as

Two-sided

Exact Binomial

Normal Approximation
